Schedule SPESD Sheet 1
Station Power for Energy Storage Devices

APPLICABILITY

This Schedule is applicable to customers with in-front-of-the-meter (IFOM) energy storage devices who will at any time charge from the grid and/or require Station Power, including customers with IFOM energy storage devices that are co-located with another generator within the same Service Delivery Point. Customers with any behind-the-meter (BTM) Generating Facilities, including energy storage devices, are not eligible for service under this Schedule.

TERRITORY

Within the entire territory served.

RATES

Customers receiving service under this Schedule are supplied retail service under their Otherwise Applicable Tariff (OAT) and applicable Standby schedule based on the characteristics of the customer's Station Power load. Except as described below, all rates and charges of the customer's retail OAT continue to apply. Nothing in this Schedule modifies the applicability of the retail schedules under which the customer would otherwise be required to receive service if the customer were not participating on this Schedule. Applicability of Departing Load charges, as provided under Schedules CGDL-CRS and DL-NBC, are determined based on the provisions of those Schedules and are not impacted by a customer's participation under this Schedule. (D)

Schedule SPESD Sheet 2
Station Power for Energy Storage Devices

SPECIAL CONDITIONS

1. Definitions: The following definitions are applicable to service provided under this Schedule only, in addition to those included in SCE Tariff Rule 1.

   a. Station Power (for energy storage devices only): All energy used by an energy storage device for purposes other than for supporting a resale of energy back to the wholesale markets.[i]

      i. When the energy storage device is charging or discharging, Station Power specifically includes all energy for information technology and communications, lighting, ventilation and safety, or other onsite loads not specifically defined in Special Condition 1.b, subject to the netting provisions of Special Condition 5.

      ii. When the energy storage device is Idle, any energy consumed onsite (and/or any mutually agreed upon amount as established on Form 14-979) is Station Power and subject to a retail rate.

      iii. For customers applying to receive service under this Schedule, prior to the completion of Form 14-979, SCE will use a retail threshold to determine idle periods and retail Station Power loads. The retail threshold is determined through statistical analysis of historical load data, focusing on transitions in station end uses and battery charging/discharging behavior. Consumption above this threshold indicates battery charging and classified as wholesale or netted load. Until calculated, the retail threshold defaults to 2% of the greater of SCE's retail meter maximum load or the nameplate capacity. (N)

      iv. These rules for stand-alone IFOM energy storage, including the permitted netting rules, apply to Hybrid resources (as defined in the California Independent System Operator Tariff, Appendix A) with only on-site self-supply for charging storage device for later resale and if the Hybrid resource does not commit to using only on-site self-supply for charging the storage device for later resale (mixed self-supply and grid charging of the storage device for later resale) retail Station Power charges will be assessed in accordance with the existing provisions of this Schedule.

[i] This definition applies only to energy storage devices, is not interchangeable with, and should not be confused with other definitions of station power in SCE or CAISO tariffs.

Schedule SPESD Sheet 3
Station Power for Energy Storage Devices

SPECIAL CONDITIONS (Continued)

1. Definitions: (Continued)

b. Wholesale Power (for energy storage devices only): All energy drawn from the grid to charge the energy storage device for later resale.

i. When the energy device is charging or discharging (*i.e.*, not Idle), Wholesale Power specifically includes charging energy, and energy for resistive losses, pumps (flow batteries and pumped hydro), power conversion systems, transformers, battery management systems, thermal regulation and vacuums (for flywheels), subject to the netting provisions of Special Condition 5.

c. Idle: When the energy storage device is neither charging (consuming kWh) nor discharging (exporting kWh) over any entire 15-minute metered interval, regardless of whether the energy storage device is providing a service (*e.g.*, ancillary service) to the grid during that same interval, but where Station Power may be consumed.

d. IFOM: When the energy storage device is located on the utility's side of the electric service provided by SCE and no loads subject to a retail rate other than Station Power are present. Under such applications, all energy discharged by the energy storage device is intended for export to the grid.

e. BTM: When the energy storage device is located on the customer's side of the electric service provided by SCE and loads subject to a retail rate other than Station Power may be present and served by the discharge of the energy storage device.

f. A Battery Energy Storage System (BESS) is an energy storage device utilizing batteries to store electrical energy for later use. BESS facilities generally participate in the wholesale markets and are subject to applicable interconnection, operational, and tariff requirements as established by the California Public Utilities Commission (CPUC) and SCE. Station Power for Energy Storage Devices

SPECIAL CONDITIONS (Continued)

2. Terms of Service.

a. A customer must affirmatively elect to participate on this Schedule when submitting the Billing Meter Application (BMA). Service under this Schedule will initiate using a two-percent (2%) retail threshold, as described in Special Condition 1. a. iii., unless or until an alternate retail threshold is calculated or an alternate Metering Provision is adopted. (N)

b. A customer applying for service under this Schedule must enter into a signed agreement with SCE using Form 14-979, *Station Power Agreement for Energy Storage Devices*. Service under this Schedule will become effective at the start of the next regularly scheduled billing period following SCE's receipt of the signed agreement and the Commercial Operating Date of the energy storage device, as defined on the customer's applicable Interconnection Agreement. (T)

c. Customers served under this Schedule are required to complete an applicable Interconnection Agreement in accordance with SCE's Federal Energy Regulatory Commission (FERC)-approved and/or California Independent System Operator (CAISO) tariffs. (T)

d. It is the customer's responsibility to notify SCE, in writing, if there is a change in the customer's equipment or operations that may change the customer's eligibility status and/or retail billing under this Schedule. (T)

e. Failure to provide SCE a completed Form 14-979 will result in the application of the 2% retail threshold, as described in Special Condition 1. a. iii., for determining Station Power Loads.. (T)(C)

Schedule SPESD Sheet 5 (N)
Station Power for Energy Storage Devices

SPECIAL CONDITIONS (Continued)

3. Metering Provisions. SCE and the customer shall negotiate measurement and metering provisions that allow for the determination of Station Power and Wholesale Power, as defined herein, within the parameters of at least one of the three options described below. Any agreed upon measurement and metering provisions must allow compliance with all applicable interconnection tariffs and must be documented on Form 14-979. All metering, equipment and protective relays necessary to implement the provisions of the Schedule are at the customer's expense. (L)

   a. All electric charging service under this Schedule may be separately metered via an independent grid tie for Station Power load and a separate tie for Wholesale Power load. The Station Power service meter shall to the extent practicable reasonably capture all of the Station Power loads. Any Station Power loads not captured should be reported to SCE at the time of interconnection or at any time when the customer first becomes aware of such Station Power loads, and shall be documented on Form 14-979.

   b. All electric charging service under this Schedule may be separately metered via a sub-metering arrangement. The Station Power service sub-meter shall to the extent practicable capture all of the Station Power loads. Any Station Power loads not captured should be reported to SCE at the time of interconnection or at any time when the customer first becomes aware of such Station Power loads, and shall be documented on Form 14-979.

   c. SCE will at its discretion accept alternative metering and measurement arrangements to the extent that the metering and measuring arrangement reasonably captures Station Power load and does not impose an administrative burden on SCE. (L)

   d. SCE may at its discretion accept idle load from the CAISO used meter, using CAISO meter 5-minute interval data where idle load is captured in a separate channel, where the CAISO meter data is made available to SCE and reasonably correlates to the SCE retail meter data, to the extent that the metering and measuring arrangement reasonably captures Station Power load and does not impose an administrative burden on SCE. (N)

Schedule SPESD Sheet 6
Station Power for Energy Storage Devices

SPECIAL CONDITIONS (Continued)

4. Billing. Billed Station Power loads will be based on metered consumption. For configurations where the Station Power load is separately metered, the bill will be based on metered registrations, subject to the netting provisions of Special Condition 5. For configurations where a separate retail meter for Station Power loads is impractical due to the energy storage device's characteristics or operational challenges, non-metered data may be substituted based on a determination of the Station Power loads. This determination must closely reflect the billing determinants had a metered option been employed, and must be documented on Form 14-979.

5. Netting Provisions. Netting for the purpose of determining retail billing under this Schedule is predicated on the following provisions.

   a. Insofar as an energy storage device withdraws (charge) or injects (discharges) more Wholesale Power subject to a dispatch at a greater absolute value than its Station Power consumption during the same 15-minute billing interval, that consumption should be able to be netted against the response to the dispatch, just as it is for conventional generators.

   b. In instances where the energy storage device's cumulative absolute value of charging plus discharging is greater than Station Power in a 15-minute billing interval, then the load is Wholesale Power. If the energy storage device's cumulative absolute value of charging plus discharging is less than the Station Power in a 15-minute billing interval, then the load is Station Power.

   c. If the energy storage device is Idle for an entire 15-minute billing interval, no netting is applicable and all load is charged at the customer's retail OAT rate as Station Power.

   d. For customers with a Scheduling Coordinator other than SCE, this netting provision shall only apply if the Scheduling Coordinator, as identified on Form 14-979, provides SCE with the information necessary to perform the calculations specified herein, as determined by SCE.
